60 (and counting)
Laravel Quick Tips

Prepared by:
Povilas Korop / LaravelDaily Team
www.laraveldaily.com
povilas@laraveldaily.com

Last updated:
April 2019

Support our work by checking our Laravel adminpanel generator: www.quickadminpanel.com
Tip 1. Invokable Controllers

From Laravel 5.6.28 - if you want to create a controller with just one action, you can use __invoke() method and even create "invokable" controller.

```php
namespace App\Http\Controllers;

use App\User;
use App\Http\Controllers\Controller;

class ShowProfile extends Controller
{
    /**
     * Show the profile for the given user.
     * @param int $id
     * @return Response
     */
    public function __invoke($id)
    {
        return view('user.profile', ['user' => User::findOrFail($id)]);
    }
}
```

Routes:
```
Route::get('user/{id}', 'ShowProfile');
```

Artisan command to generate this controller:
```
php artisan make:controller ShowProfile --invokable
```

Tip 2. Unsigned Integer

For foreign key migrations instead of `integer()` use `unsignedInteger()` type or `integer() -> unsigned()`, otherwise you may get SQL errors.
Schema::create('employees', function (Blueprint $table) {
    $table->unsignedInteger('company_id');
    $table->foreign('company_id')->references('id')->on('companies');
    // ...
});

Tip 3. OrderBy on Eloquent relationships

You can specify `orderBy()` directly on your Eloquent relationships.

```php
public function products()
{
    return $this->hasMany(Product::class);
}

public function productsByName()
{
    return $this->hasMany(Product::class)->orderBy('name');
}
```

Tip 4. Order of Migrations

If you want to change the order of DB migrations, just rename the file's timestamp, like from `2018_08_04_070443_create_posts_table.php` to `2018_07_04_070443_create_posts_table.php` *(changed from 2018_08_04 to 2018_07_04)*. They run in alphabetical order.

Tip 5. Raw DB Queries

You can use RAW DB queries in various places, including `havingRaw()` function after `groupBy()`.

```php
Product::groupBy('category_id')->havingRaw('COUNT(*) > 1')->get();
```

Support our work by checking our Laravel adminpanel generator: [www.quickadminpanel.com](http://www.quickadminpanel.com)
Support our work by checking our Laravel adminpanel generator: www.quickadminpanel.com
Tip 6. $loop variable in foreach

Inside of foreach loop, check if current entry is first/last by just using $loop variable.

```php
@foreach ($users as $user)
    @if ($loop->first)
        This is the first iteration.
    @endif

    @if ($loop->last)
        This is the last iteration.
    @endif

    <p>This is user {{ $user->id }}</p>
@endforeach
```

There are also other properties like $loop->iteration or $loop->count.
More here: [https://laravel.com/docs/master/blade#the-loop-variable](https://laravel.com/docs/master/blade#the-loop-variable)

---

Tip 7. Eloquent where date methods

In Eloquent, check the date with functions `whereDay()`, `whereMonth()`, `whereYear()`, `whereDate()` and `whereTime()`.

```php
$products = Product::whereDate('created_at', '2018-01-31')->get();
$products = Product::whereMonth('created_at', '12')->get();
$products = Product::whereDay('created_at', '31')->get();
$products = Product::whereYear('created_at', date('Y'))->get();
$products = Product::whereTime('created_at', '=', '14:13:58')->get();
```

---

Support our work by checking our Laravel adminpanel generator: [www.quickadminpanel.com](http://www.quickadminpanel.com)
Tip 8. Route group within a group

in Routes, you can create a group within a group, assigning a certain middleware only to some URLs in the "parent" group.

```php
Route::group(['prefix' => 'account', 'as' => 'account.'], function() {
    Route::get('login', 'AccountController@login');
    Route::get('register', 'AccountController@register');

    Route::group(['middleware' => 'auth'], function() {
        Route::get('edit', 'AccountController@edit');
    });
});
```

Tip 9. Increments and decrements

if you want to increment some DB column in some table, just use `increment()` function. Oh, and you can increment not only by 1, but also by some number, like 50.

```php
Post::find($post_id)->increment('view_count');
User::find($user_id)->increment('points', 50);
```

Tip 10. Does view file exist?

You can check if View file exists before actually loading it.

```php
if (view()->exists('custom.page')) {
    // Load the view
}
```

You can even load an array of views and only the first existing will be actually loaded.

```php
return view()->first(['custom.dashboard', 'dashboard'], $data);
```
Tip 11. No timestamp columns

If your DB table doesn’t contain timestamp fields created_at and updated_at, you can specify that Eloquent model wouldn’t use them, with $timestamps = false property.

```php
class Company extends Model
{
    public $timestamps = false;
}
```

Tip 12. Migration fields with timezones

Did you know that in migrations there’s not only timestamps() but also timestampsTz(), for the timezone?

```php
Schema::create('employees', function (Blueprint $table) {
    $table->increments('id');
    $table->string('name');
    $table->string('email');
    $table->timestampsTz();
});
```

Also, there are columns dateTimeTz(), timeTz(), timestampTz(), softDeletesTz().

Tip 13. Eloquent has() deeper

You can use Eloquent has() function to query relationships even two layers deep!

```php
// Author -> hasMany(Book::class);
// Book -> hasMany(Rating::class);
$authors = Author::has('books.ratings')->get();
```

Support our work by checking our Laravel adminpanel generator: www.quickadminpanel.com
Tip 14. Database migrations column types

There are interesting column types for migrations, here are a few examples.

$table->geometry('positions');
$table->ipAddress('visitor');
$table->macAddress('device');
$table->point('position');
$table->uuid('id');

See all column types: https://laravel.com/docs/master/migrations#creating-columns

Tip 15. Artisan command help

To check the options of artisan command, Run artisan commands with --help flag. For example, php artisan make:model --help and see how many options you have:

Options:
- a, --all Generate a migration, factory, and resource controller for the model
- c, --controller Create a new controller for the model
- f, --factory Create a new factory for the model
- m, --migration Create a new migration file for the model.
- p, --pivot Indicates if the generated model should be a custom intermediate table model.
- r, --resource Indicates if the generated controller should be a resource controller.
- h, --help Display this help message
- q, --quiet Do not output any message
- V, --version Display this application version
- --ansi Force ANSI output
- --no-ansi Disable ANSI output
- n, --no-interaction Do not ask any interactive question
- --env=[ENV] The environment the command should run under
- v|vv|vvv, --verbose Increase the verbosity of messages: 1 for normal output, 2 for more verbose output and 3 for debug

Support our work by checking our Laravel adminpanel generator: www.quickadminpanel.com
Tip 16. Default Timestamp

While creating migrations, you can use `->timestamp()` column type with option `->useCurrent()`, it will set `CURRENT_TIMESTAMP` as default value.

```php
$table->timestamp('created_at')->useCurrent();
$table->timestamp('updated_at')->useCurrent();
```

Tip 17. Set logged in user with Observers

Use `make:observer` and fill in `creating()` method to automatically set up `user_id` field for current logged in user.

```php
class PostObserver
{
    /**
     * Handle to the post "creating" event.
     *
     * @param  \App\Post  $post
     * @return void
     */
    public function creating(Post $post)
    {
        $post->user_id = auth()->id();
    }
}
```

Tip 18. Soft-deletes: multiple restore

When using soft-deletes, you can restore multiple rows in one sentence.

```php
Post::withTrashed()->where('author_id', 1)->restore();
```
Tip 19. Has Many. How many exactly?

In Eloquent `hasMany()` relationships, you can filter out records that have X amount of children records.

```php
// Author -> hasMany(Book::class)
$authors = Author::has('books', '>', 5)->get();
```

Tip 20. Image validation

While validating uploaded images, you can specify the dimensions you require.

```json
'photo' => 'dimensions:max_width=4096,max_height=4096'
```

Tip 21. Wildcard subdomains

You can create route group by dynamic subdomain name, and pass its value to every route.

```php
Route::domain('{username}.workspace.com')->group(function () {
    Route::get('user/{id}', function ($username, $id) {
        //
        });
});
```

Tip 22. Exact Laravel version

Find out exactly what Laravel version you have in your app, by running command
```
php artisan --version
```
Tip 23. Testing email into laravel.log

If you want to test email contents in your app but unable or unwilling to set up something like Mailgun, use .env parameter MAIL_DRIVER=log and all the email will be saved into storage/logs/laravel.log file, instead of actually being sent.

Tip 24. Error code Blade pages

If you want to create a specific error page for some HTTP code, like 500 - just create a blade file with this code as filename, in resources/views/errors/500.blade.php, or 403.blade.php etc, and it will automatically be loaded in case of that error code.

Tip 25. Factory callbacks

While using factories for seeding data, you can provide Factory Callback functions to perform some action after record is inserted.

```php
$factory->afterCreating(App\User::class, function ($user, $faker) {
    $user->accounts()->save(factory(App\Account::class)->make());
});
```

Tip 26. Artisan command parameters

When creating Artisan command, you can ask the input in variety of ways: $this->confirm(), $this->anticipate(), $this->choice().

```php
// Yes or no?
if ($this->confirm('Do you wish to continue?')) {
    //
}
```

```php
// Open question with auto-complete options
$name = $this->anticipate('What is your name?', ['Taylor', 'Dayle']);
```

```php
// One of the listed options with default index
$name = $this->choice('What is your name?', ['Taylor', 'Dayle'], $defaultIndex);
```

Support our work by checking our Laravel adminpanel generator: www.quickadminpanel.com
Tip 27. Preview Mailables

If you use Mailables to send email, you can preview the result without sending, directly in your browser. Just return a Mailable as route result:

```php
Route::get('/mailable', function () {
    $invoice = App\Invoice::find(1);
    return new App\Mail\InvoicePaid($invoice);
});
```

Tip 28. Don't create Controllers

If you want route to just show a certain view, don't create a Controller method, just use Route::view() function.

```php
// Instead of this
Route::get('about', 'TextsController@about');
// And this
class TextsController extends Controller
{
    public function about()
    {
        return view('texts.about');
    }
}

// Do this
Route::view('about', 'texts.about');
```
Tip 29. Blade @auth

Instead of if-statement to check logged in user, use @auth directive.

Typical way:

```php
@if(auth()->user())
   // The user is authenticated.
@endif
```

Shorter:

```php
@auth
   // The user is authenticated.
@endauth
```

Tip 30. Model all: columns

When calling Eloquent's `Model::all()`, you can specify which columns to return.

```php
$users = User::all(['id', 'name', 'email']);
```

Tip 31. Localhost in .env

Don't forget to change APP_URL in your .env file from `http://localhost` to real URL, cause it will be the basis for any links in your email notifications and elsewhere.

```
APP_NAME=Laravel
APP_ENV=local
APP_KEY=base64:9PHz3TL5C4YrdV6Gg/Xkkmx9btaE93j7rQTUZWm2MqU=
APP_DEBUG=true
APP_URL=http://localhost
```
Tip 32: What's behind the routes?

Want to know what routes are actually behind `Auth::routes()`? Check the file `/vendor/laravel/framework/src/Illuminate/Routing/Router.php`.

Note that in Laravel 5.7 it also has a new option for verification emails.

```php
public function auth(array $options = [])
{
    // Authentication Routes...
    $this->get('login', 'Auth\LoginController@showLoginForm')->name('login');
    $this->post('login', 'Auth\LoginController@login');
    $this->post('logout', 'Auth\LoginController@logout')->name('logout');

    // Registration Routes...
    if ($options['register'] ?? true) {
        $this->get('register', 'Auth\RegisterController@showRegistrationForm')->name('register');
        $this->post('register', 'Auth\RegisterController@register');
    }

    // Password Reset Routes...
    $this->get('password/reset', 'Auth\ForgotPasswordController@showLinkRequestForm')->name('password.request');
    $this->post('password/email', 'Auth\ForgotPasswordController@sendResetLinkEmail')->name('password.email');
    $this->get('password/reset/{token}', 'Auth\ResetPasswordController@showResetForm')->name('password.reset');
    $this->post('password/reset', 'Auth\ResetPasswordController@reset')->name('password.update');

    // Email Verification Routes...
    if ($options['verify'] ?? false) {
        $this->emailVerification();
    }
}

public function emailVerification()
{
    $this->get('email/verify', 'Auth\VerificationController@show')->name('verification.notice');
    $this->get('email/verify/{id}', 'Auth\VerificationController@verify')->name('verification.verify');
    $this->get('email/resend', 'Auth\VerificationController@resend')->name('verification.resend');
}
```

Support our work by checking our Laravel adminpanel generator: [www.quickadminpanel.com](http://www.quickadminpanel.com)
Tip 33. To Fail or not to Fail

In addition to `findOrFail()`, there's also Eloquent method `firstOrFail()` which will return 404 page if no records for query are found.

```php
$user = User::where('email', 'povilas@laraveldaily.com')->firstOrFail();
```

Tip 34. Column name change

in Eloquent Query Builder, you can specify "as" to return any column with a different name, just like in plain SQL query.

```php
$users = DB::table('users')
    ->select('name', 'email as user_email')
    ->get();
```

Tip 35. Logging with parameters

You can write `Log::info()`, or shorter `info()` message with additional parameters, for more context about what happened.

```php
Log::info('User failed to login.', ['id' => $user->id]);
```

Tip 36. Default Model

You can assign a default model in `belongsTo` relationship, to avoid fatal errors when calling it like `{{ $post->user->name }}` if `$post->user` doesn't exist.

```php
/**
 * Get the author of the post.
 */
public function user()
{
    return $this->belongsTo('App\User')->withDefault();
}
```

Support our work by checking our Laravel adminpanel generator: www.quickadminpanel.com
Tip 37. Use hasMany to create Many

If you have `hasMany()` relationship, you can use `saveMany()` to save multiple "child" entries from your "parent" object, all in one sentence.

```php
$post = Post::find(1);
$post->comments()->saveMany([new Comment(['message' => 'First comment']), new Comment(['message' => 'Second comment'])]);
```

Tip 38. More convenient DD

Instead of doing `dd($result);` you can put `->dd()` as a method directly at the end of your Eloquent sentence, or any Collection.

```php
// Instead of
$users = User::where('name', 'Taylor')->get();
dd($users);

// Do this
$users = User::where('name', 'Taylor')->get()->dd();
```

Tip 39. Map query results

After Eloquent query you can modify rows by using `map()` function in Collections.

```php
$users = User::where('role_id', 1)->get()->map(function (User $user) {
    $user->some_column = some_function($user);
    return $user;
});
```

Support our work by checking our Laravel adminpanel generator: [www.quickadminpanel.com](http://www.quickadminpanel.com)
Tip 40. Custom validation error messages

You can customize validation error messages per field, rule and language - just create a specific language file resources/lang/xx/validation.php with appropriate array structure.

```php
'custom' => [
    'email' => [
        'required' => 'We need to know your e-mail address!',
    ],
],
```

---

Tip 41. When (NOT) to run “composer update”

Not so much about Laravel, but... Never run composer update on production, it's slow and will "break" repository. Always run composer update locally on your computer, commit new composer.lock to the repository, and run composer install on server.

---

Tip 42. Two-level $loop variable in Blade

In Blade's foreach you can use $loop variable even in two-level loop to reach parent variable.

```blade
@foreach ($users as $user)
    @foreach ($user->posts as $post)
        @if ($loop->parent->first)
            This is first iteration of the parent loop.
        @endif
    @endforeach
@endforeach
```

Support our work by checking our Laravel adminpanel generator: www.quickadminpanel.com
Tip 43. How to avoid error in {{ $post->user->name }} if user is deleted?

You can assign a default model in belongsTo relationship, to avoid fatal errors when calling it like
{{ $post->user->name }} if $post->user doesn't exist.

```php
/**
 * Get the author of the post.
 */
public function user()
{
    return $this->belongsTo('App\User')->withDefault();
}
```

Tip 44. Load array of Views

You can load Blade views in array with view()->first($array), it will load only the first one
that actually exists. Useful when you may have custom file not generated for one of the "themes",
and provide a default fallback.

```php
return view()->first(['custom.admin', 'admin'], $data);
```

Tip 45. Route Model Binding: You can define a key

You can do Route model binding like Route::get('api/users/{user}', function
(App\User $user) { ... }) - but only by ID field. If you want {user} to be a username
field, put this in the model:

```php
public function getRouteKeyName() {
    return 'username';
}
```
Tip 46. Redirect to Specific Controller Method

You can redirect() not only to URL or specific route, but to a specific Controller's specific method, and even pass the parameters. Use this:

```
return redirect()->action('SomeController@method',
    ['param' => $value]);
```

Tip 47. Did you know about Auth::once()?

You can login with user only for ONE REQUEST, using method Auth::once(). No sessions or cookies will be utilized, which means this method may be helpful when building a stateless API.

```
if (Auth::once($credentials)) {
    //
}
```

Tip 48. Eager Loading with Exact Columns

You can do Laravel Eager Loading and specify the exact columns you want to get from the relationship.

```
$users = App\Book::with('author:id,name')->get();
```

Tip 49. Validate dates with "now" or "yesterday" words

You can validate dates by rules before/after and passing various strings as a parameter, like: "tomorrow", "now", "yesterday". Example: 'start_date' => 'after:now'. It's using strtotime() under the hood.

```
$rules = [
    'start_date' => 'after:tomorrow',
    'end_date' => 'after:start_date'
];
```

Support our work by checking our Laravel adminpanel generator: www.quickadminpanel.com
Tip 50. Touch parent updated_at easily

If you are updating a record and want to update the updated_at column of parent relationship (like, you add new post comment and want posts_updated_at to renew), just use $touches = ['post']; property on child model.

```php
class Comment extends Model
{
    /**
     * All of the relationships to be touched.
     *
     * @var array
     */
    protected $touches = ['post'];
}
```

Tip 51. Quickly Navigate from Routes file to Controller

Instead of routing like this:
`Route::get('page', 'PageController@action');`

You can specify the Controller as a class:
`Route::get('page', [\App\Http\Controllers\PageController::class, 'action']);`

Then you will be able to click on “PageController” in PhpStorm, and navigate directly to Controller, instead of searching for it manually.

Tip 52. Always Check if Relationship Exists

Never ever do $model->relationship->field without checking if relationship object still exists.

It may be deleted for whatever reason, outside your code, by someone else’s queued job etc. Do if-else, or `{{ $model->relationship->field ?? '' }}` in Blade.

Support our work by checking our Laravel adminpanel generator: www.quickadminpanel.com
Tip 53. Don’t Filter by NULL in Collections

You can filter by NULL in Eloquent, but if you’re filtering the collection further - filter by empty string, there’s no “null” in that field anymore.

```php
// This works
$messages = Message::where('read_at is null')->get();

// Won’t work - will return 0 messages
$messages = Message::all();
$unread_messages = $messages->where('read_at is null')->count();

// Will work
$unread_messages = $messages->where('read_at', '')->count();
```

Tip 54. Default Email Subject in Laravel Notifications

If you send Laravel Notification and don’t specify subject in `toMail()`, default subject is your notification class name, CamelCased into Spaces.

So, if you have:

```php
class UserRegistrationEmail extends Notification {
    // ...
}
```

Then you will receive an email with subject "User Registration Email".

Tip 55. Composer: Check for Newer Versions

If you want to find out which of your `composer.json` packages have released newer versions, just run "composer outdated". You will get a full list with all information, like this below.

```
phpdocumentor/type-resolver 0.4.0 0.7.1
phpunit/php-code-coverage  6.1.4 7.0.3 Library that provides collection, processing, and rende...
phpunit/phpunit               7.5.9 8.1.3 The PHP Unit Testing framework.
ralouphie/getallheaders     2.0.5 3.0.3 A polyfill for getallheaders.
sebastian/global-state      2.0.0 3.0.0 Snapshotting of global state
```
Tip 56. Route Fallback - When no Other Route is Matched

If you want to specify additional logic for not-found routes, instead of just throwing default 404 page, you may create a special Route for that, at the very end of your Routes file.

```php
Route::group(['middleware' => ['auth'], 'prefix' => 'admin', 'as' => 'admin.'], function () {
    Route::get('/home', 'HomeController@index');
    Route::resource('tasks', 'Admin\TasksController');
});

// Some more routes....

Route::fallback(function() {
    return 'Hm, why did you land here somehow?';
});
```

---

Tip 57. Create Your Own Blade Directive

It’s very easy - just add your own method in `app/Providers/AppServiceProvider.php`:

For example, if you want to have this for replace `<br>` tags with new lines:

```html
<textarea>@br2nl($post->post_text)</textarea>
```

Add this directive to AppServiceProvider’s `boot()` method:

```php
public function boot()
{
    Blade::directive('br2nl', function ($string) {
        return '<?php echo preg_replace('/\<br\s*/?\?>/i', "\n", $string); ?>";
    });
}
```

---

Support our work by checking our Laravel adminpanel generator: [www.quickadminpanel.com](http://www.quickadminpanel.com)
Tip 58. Use withCount() to Calculate Child Relationships Records

If you have `hasMany()` relationship, and you want to calculate “children” entries, don’t write a special query. For example, if you have posts and comments on your User model, write this `withCount()`:

```php
public function index()
{
    $users = User::withCount(['posts', 'comments'])->get();
    return view('users', compact('users'));
}
```

And then, in your Blade file, you will access those number with `[relationship]_count` properties:

```blade
@foreach ($users as $user)
    <tr>
        <td>{{ $user->name }}</td>
        <td class="text-center">{{ $user->posts_count }}</td>
        <td class="text-center">{{ $user->comments_count }}</td>
    </tr>
@endforeach
```

Tip 59. Use groupBy on Collections with Custom Callback Function

If you want to group result by some condition whith isn’t a direct column in your database, you can do that by providing a closure function.

For example, if you want to group users by day of registration, here’s the code:

```php
$users = User::all()->groupBy(function($item) {
    return $item->created_at->format('Y-m-d');
});
```

**Notice**: it is done on a `Collection` class, so performed **AFTER** the results are fetched from the database.

Support our work by checking our Laravel adminpanel generator: [www.quickadminpanel.com](http://www.quickadminpanel.com)
Tip 60. Blade Directives: IncludeIf, IncludeWhen, IncludeFirst

If you are not sure whether your Blade partial file actually would exist, you may use these condition commands:

This will load header only if Blade file exists
@includeIf('partials.header')

This will load header only for user with role_id 1
@includeWhen(auth()->user()->role_id == 1, 'partials.header')

This will try to load adminlte.header, if missing - will load default.header
@includeFirst('adminlte.header', 'default.header')

To be continued…
